## Two-Way Coaxial Switches

SPINNER supplies a wide variety of switch types for highly demanding applications. Their RF ratings range from a few watts to several hundred kilowatts, and they are available for sizes from N to $61 / 8^{\prime \prime}$ EIA and frequencies up to several GHz .

SPINNER's RF switches consist of different drive types (lifting magnet, impulse solenoid or motor drive) for switching times from 25 ms up to about one second. The two-way switches, which come in $41 / 2^{\prime \prime}$ IEC and $61 / 8^{\prime \prime}$ EIA, are the fastest RF switches available in the marketplace.

Due to their extremely compact dimensions and exceptional dependability, SPINNER switches are preferred for systems that must be highly reliable. The $2+1$ and $4+1$ switching units developed by SPINNER are excellently suited for ensuring operation of redundant systems. In 19 " rack systems, these compact switching systems have a height of only 1 rack unit yet are able to keep remote stations broadcasting even if a transmitter should fail.

## Manual Operation

With manually operated switches, the switch position is selected using a knob. The switch locks at its end positions to reliably maintain them even if it is subjected to vibrations or rotates around a rotor axis

## Impulse Solenoid Drive

In switches with an impulse solenoid drive, the rotor torque is generated by a rotating permanent magnet surrounded by a stationary coil. The drive system has two stable switching positions and locks in both end positions (i.e. it is latching). A pulse is therefore sufficient as a control signal (no control voltage is required after switching). In the event of a power failure or system restart, the most recent switch position is retained.

There is also a failsafe switch version that is reset to its initial position by a spring if the power fails.

## Lifting Magnet Drive

In this version, electromagnetic force moves a lever from its resting position to its final position. When the current stops, the lever is reset to its resting position by an externally applied force such as a spring. Either the drive is not locked in either position (monostable) or else it is held in place by an auxiliary magnet (bistable).

## Motor Drive

Motorized switches are turned by a special gear mechanism developed by SPINNER (see "hypocycloid gear mechanism" below). This drive system rotates by $90^{\circ}$ and locks in both end positions.

## Hypocycloid Gear Mechanism

The drive and switch base (rotor) are connected by a special gear mechanism developed by SPINNER. This mechanism varies the torque and angular velocity across the switch's rotational range. Initially, the torque is very high while the angular velocity of the switch rotor is very low. Then, as the angle increases the angular velocity steadily increases while the torque decreases. After passing the middle of the range, this is reversed and the angular velocity decreases while the torque increases. The drive mechanically locks in both end positions.

## Signaling and Interlock Contacts

Potential-free SPDT contacts (signaling contacts) indicate the current switch position.
The interlock contacts are coupled with RF contacts for interrupting RF power before and during switching. They open before the RF contacts separate and closes after the RF contacts are in their new position.

The maximum switching limits of these contacts are 42.4 VACpk / 60 VDC / 0.5 A. For BN 512663 and BN 512665 the limits are 42.4 VACpk / $50 \mathrm{VDC} / 0.1 \mathrm{~A}$.

## Two-Way Coaxial Switches

## Protection Class

The protection class is IP40 (EN60529), meaning that the switches are only suitable for indoor use. Switches for outdoor installation are also available on request.

## Power Ratings

All power ratings apply to room temperature (about $25^{\circ} \mathrm{C}$ ), normal air pressure (about 1000 hPa ), relative humidity of about $50 \%$ and an RF-matched state. Specified power ratings are for the highest given frequency and can be transmitted via both switch paths concurrently. If you require operation with pulsed power, please send us detailed data.

## Dimensions

All dimensions are in mm .

## Note:

The maximum average transmittable power of digital signals (e.g. DAB, DVB-T, ATSC, ISDB-T etc.) is rated by applying an RF proof voltage while taking the crest factor into account. When operating multiple transmitters with analog or digital signals, the sum of their voltages must be considered.
